

 H5LDLMM**Question**

LDL-C method of measurement. When TG < 400 mg/dl, LDL-C was indirectly calculated from the respondent-specific concentrations (mg/dl) of total cholesterol, high-density lipoprotein cholesterol, and triglycerides using the Friedewald equation ($LDL-C = TC - HDL-C - [TG/5]$). When TG \geq 400 mg/dl, LDL-C was directly measured.

1	indirect calculation
2	directly measured
